USE CASE DIAGRAM:-

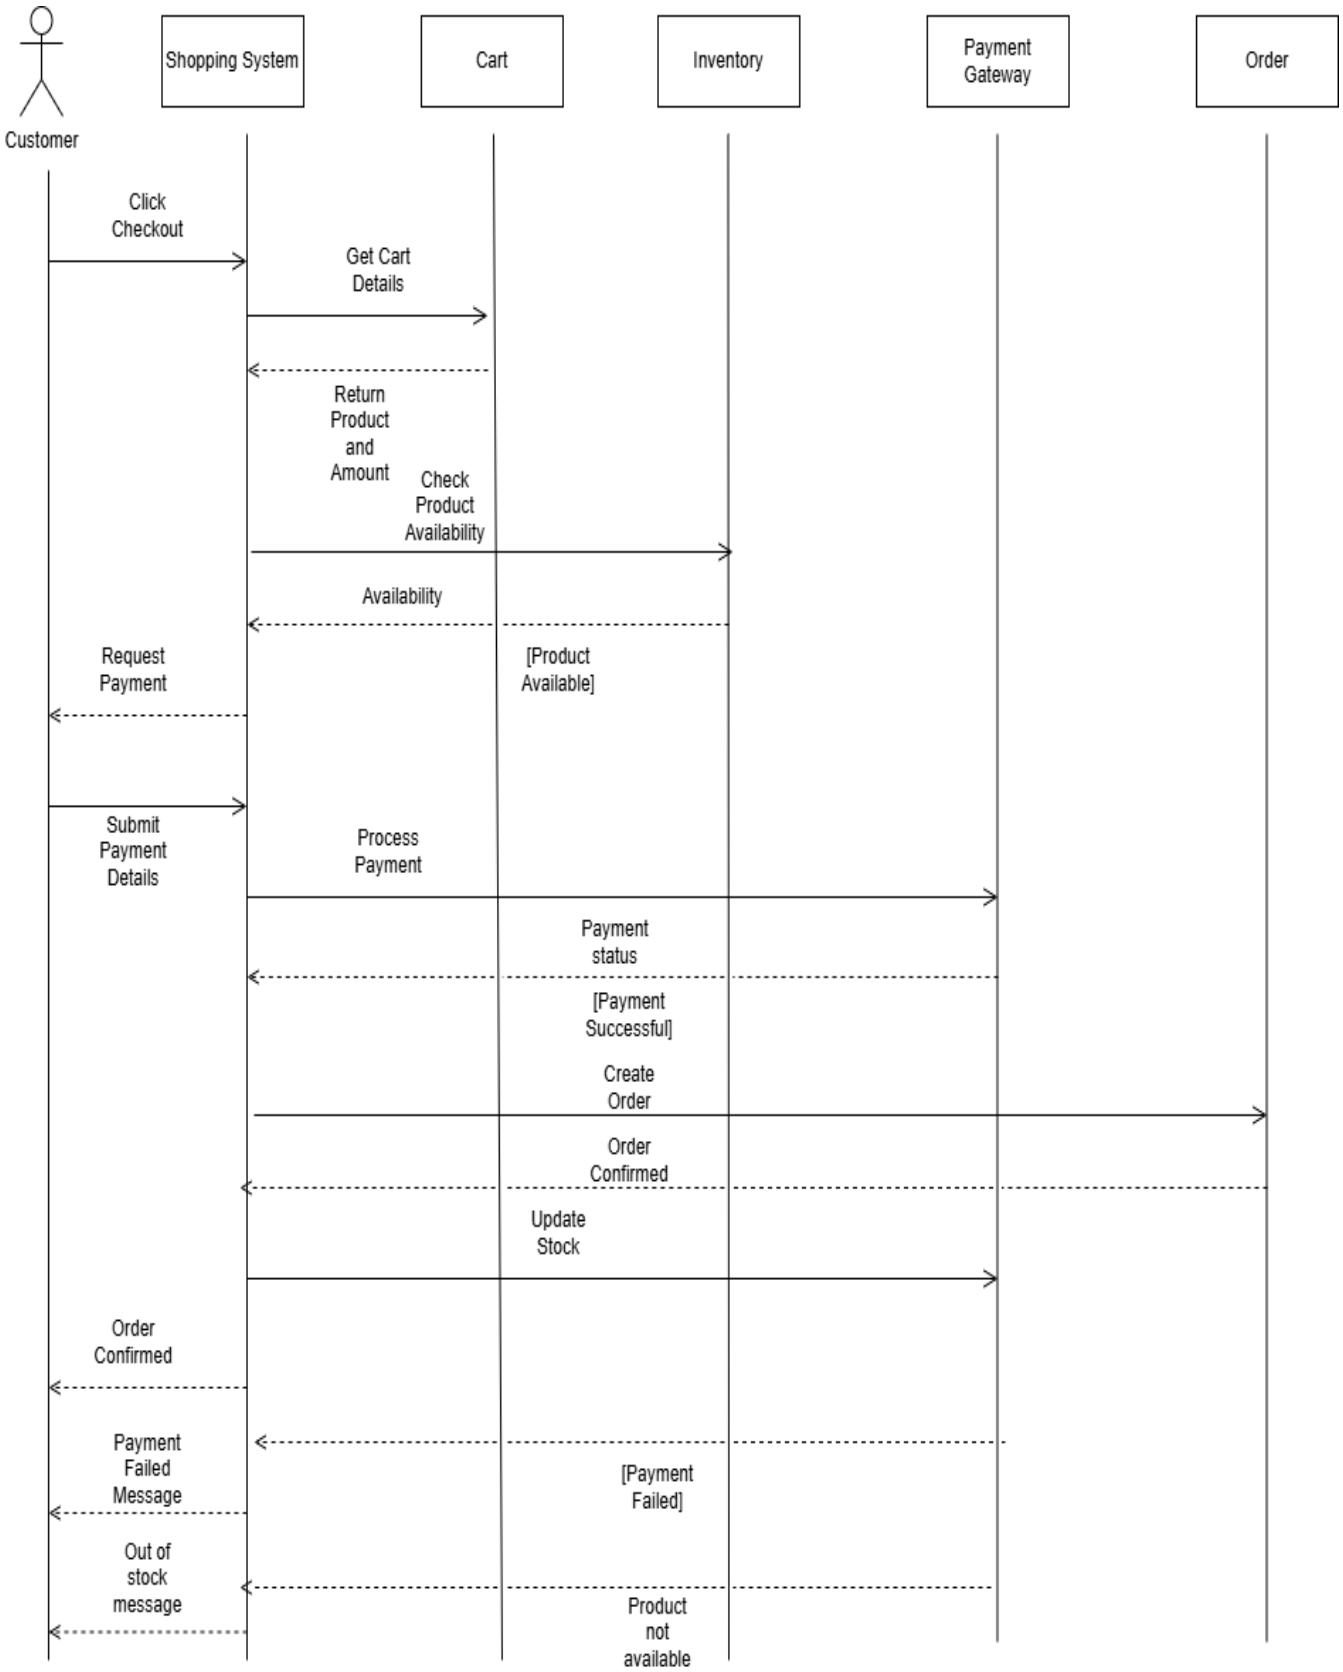

CLASS DIAGRAM

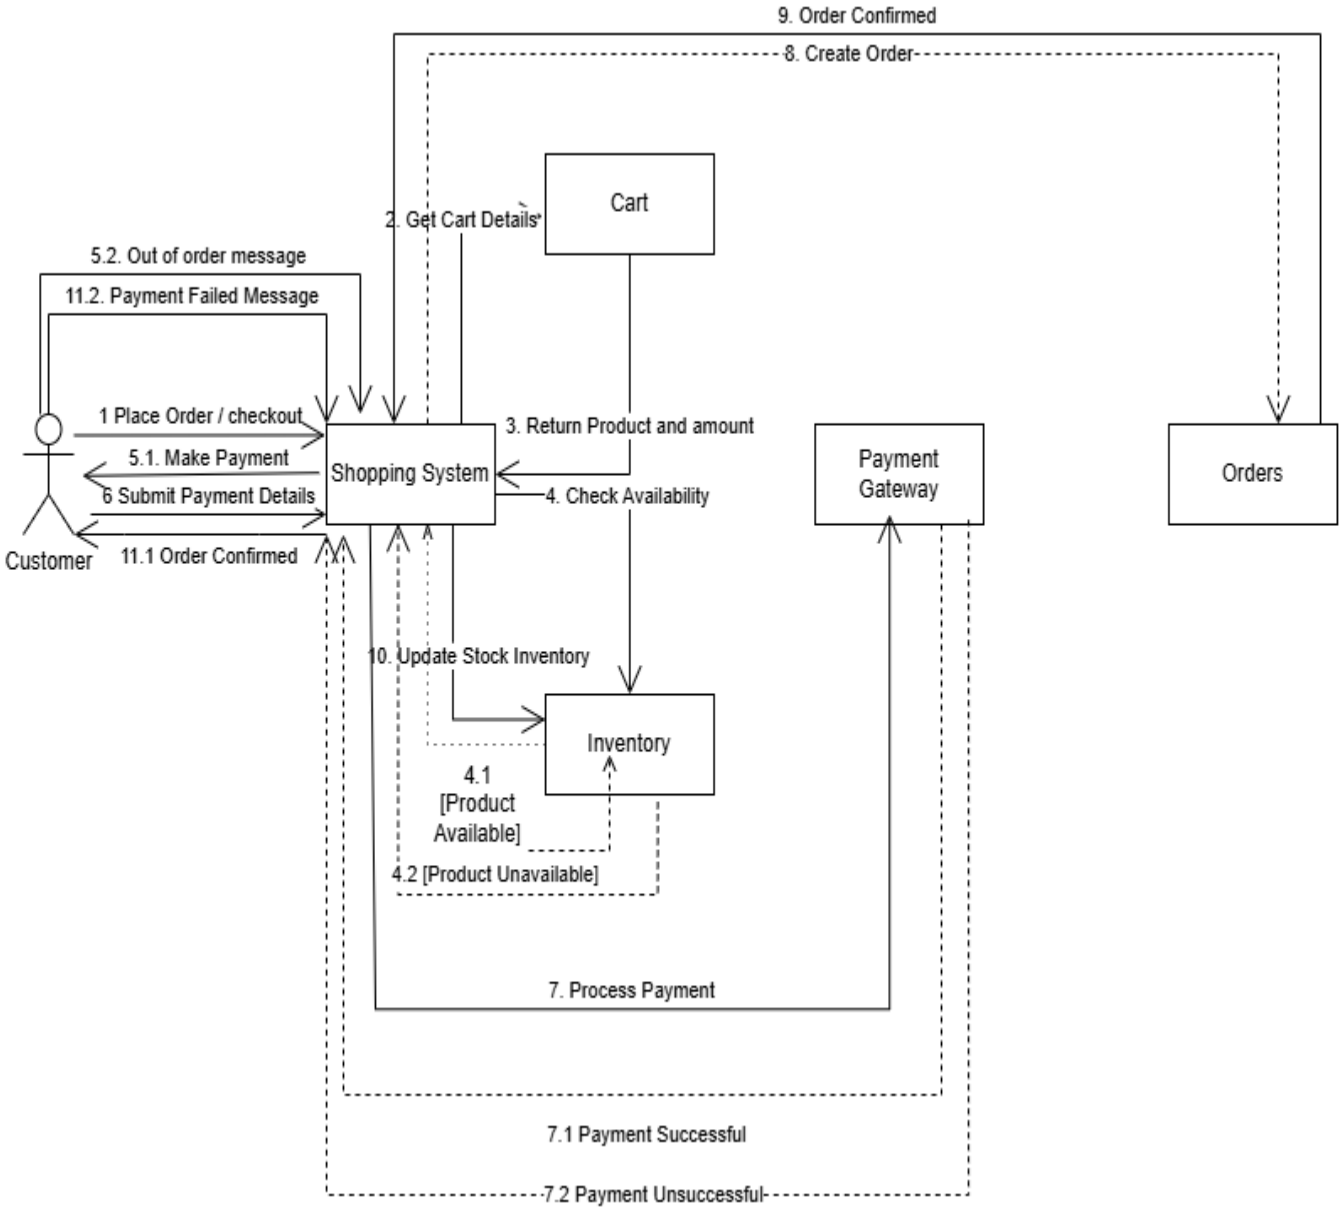

- **Association:** Represents a relationship between two classes where their objects are connected, usually shown by a solid line.
- **Directed Association:** Represents a relationship between two classes with a specific direction, showing that one class is associated with another.
- **Aggregation:** Represents a weak whole-part relationship where the part can exist independently of the whole, shown by a hollow diamond.
- **Composition:** Represents a strong whole-part relationship where the part cannot exist independently of the whole, shown by a filled diamond.
- **Generalization (Inheritance):** Represents an is-a relationship where a subclass inherits properties and behaviors from a superclass.
- **Realization (Interface Implementation):** Represents a relationship where a class implements the features or operations defined by an interface.
- **Dependency Relationship:** Represents a weak relationship where one class depends on another class for some functionality.
- **Usage (Dependency) Relationship:** Represents a dependency where one class uses the services or functionality provided by another class.
